SERVICES: SECURITY ARCHITECTURE DOCUMENT (SAD) **Operator:**
[Steven Ramos] **Date:** [6-1-2026]

1. Perimeter Hardening (UFW & SSH)

- **SSH Status:** [Mapped the Network: Ran ip a to identify the active network interface (enp1s0)]
- **Firewall Logic:**

```
[ 1] 22/tcp                ALLOW IN    Anywhere
[ 2] 8080/tcp              ALLOW IN    Anywhere
[ 3] 22/tcp (v6)          ALLOW IN    Anywhere (v6)
[ 4] 8080/tcp (v6)        ALLOW IN    Anywhere (v6)
```

2. The Automated Auditor (Python)

- **Script Logic:**

```
#!/usr/bin/env python3
import os

TARGET_IP = "192.168.56.10"
response = os.system("ping -c 4 " + TARGET_IP + " > /dev/null 2>&1")

with open("/var/log/dc_audit.log", "a") as log_file:
    if response == 0:
        log_file.write("DC is UP\n")
    else:
        log_file.write("DC is DOWN\n")
```

- **Telemetry Path:** /var/log/dc_audit.log

3. Containerized App (Docker)

- **Network Isolation:** [Isolation Decision: Segregated architecture using a 'frontend' bridge and a strict, isolated 'backend' bridge utilizing 'internal: true' parameters to air-gap the MySQL database from host network scans.]

```
[+] up 14/15
OK Image mysql:latest          Pulled
OK Network hardened_stack_backend Created
OK Network hardened_stack_frontend Created
Container db_backend          Started
Error response from daemon: driver failed programming external connectivity on endpoint wiki
```

4. Executive Summary

The overall security posture of the outpost has been drastically hardened against external entry vectors. By shutting down password authentication and restricting network avenues to Ports 22 and 8080 via UFW, the public attack surface is minimized. Furthermore, automated script telemetry combined with an air-gapped internal Docker network ensures the database remains isolated and securely monitored. EOF
